Dr. Beard was first to report that in many respects this trophoblast in its early form, looks and behaves like a typical malignant tumor. It begins growing as a very undifferentiated offshoot of the primitive blastocyst (embryo at four days), its cells multiplying almost without control, as tumors were known to do even in Beard's day.

Trophoblast | embryology | Britannica

Trophoblasts are cells forming the outer layer of a blastocyst, which provide nutrients to the embryo and develop into a large part of the placenta. They are formed during the first stage of pregnancy and are the first cells to differentiate from the fertilized egg. This layer of trophoblasts is also collectively referred to as "the trophoblast", or, after gastrulation, the trophoderm, as it is then contiguous with the ectoderm of the embryo.

Trophoblast - Wikipedia

Cells of the trophoblast lineage have thus been recovered from the uterine cavity and endocervical canal. An emerging non-invasive technology [trophoblast retrieval and isolation from the cervix (TRIC)] isolates and examines EVT cells residing in the cervix to explore their origin, biology and relationship to pregnancy and fetal status.

The name "Trophoblast" was used for the first time by Ambrosius Arnold Willem Hubrecht (1853 – 1915) at the meeting of the Anatomical Congress at Wiirzburg in 1888, and its earliest definition is found in the report of that meeting in Nos. 17 and 18 of the Anatomischer Anzeiger, Bd. III.

Trophoblast - Embryology

As the main structural and functional components, the origin of the trophoblast lineage in the placenta remains an unresolved issue. The lineage specification between the TE and the ICM is the earliest cell-fate determination during embryonic development [10, 11].

A quick history and overview Dr. John Beard is credited with finding the link between tumors, trophoblasts and pancreatic enzymes. The trophoblast is the tissue that gives rise to the placenta and embryo. It took roughly 20 years of careful science to discover and document the similarities between trophoblasts and tumors. Dr.

The extravillous trophoblast is considered the cell of origin for both PSTT and epithelioid trophoblastic tumor (ETT) lesions, which are significantly less common than tumors of the villous trophoblast. Extravillous trophoblasts are derived from cytotrophoblast in two scenarios.
